

# NAB Online Retail Sales Index August 2025

## NAB Group Economics

### Key Points

- **On a seasonally adjusted basis, the NAB Online Retail Sales Index recorded an almost flat result (-0.1% mom) on the month prior (July revised -1.1%, was -1.0%).**
- **While slowing, growth remained strong in year-on-year terms (15.1% yoy),** although July was revised lower (previously 16.2%).
- **Growth was mixed in the month, with a large drop in department store sales and a fall in takeaway food sales almost offset by growth in all other categories.** Large sales category, homewares and appliances, returned to growth in August after contracting heavily in July. Looking through the recent monthly volatility, this category is beginning to trend higher in growth terms, consistent with a pick-up in house prices and housing turnover. The department stores category continues to lead in year-on-year terms. For more detail, see Charts 3, 5, 7 & 8 and Table 3 below.
- **August saw improvement in monthly growth across all states except TAS and QLD, with growth positive for both WA and SA.** While the two largest sales states, NSW and VIC, recorded large falls the month prior, NSW returned to a relatively better position this month (flat) with grocery and liquor, and homewares and appliances key to the result. See Charts 4, 6, 9-14, and Table 3 for more detail.
- **Regional areas recorded growth in the month, but this was outweighed by the fall in metro areas, albeit less negative than the month prior.** In year-on-year terms, metro areas still lead, especially in SA, WA and VIC. See Charts 15 and 16 for more detail.
- **International retailers again recorded growth.** Domestic growth improved to an almost flat position. See Charts 13 and 14 and Table 4 for category growth and share.
- **NAB estimates that in the 12 months to August, Australians spent \$65.65 billion on online retail,** a level that is around 14.8% of the total retail trade estimate from the ABS Monthly Household Spending indicator – Retail Trade estimate (July 2025, Series 5682, Australian Bureau of Statistics), with the 12-months-to growth (14.4%) continuing to accelerate.

Year-on-year growth (% s.a.)			
	Jun-25	Jul-25	Aug-25
NAB Online Index	15.4	15.8	15.1
ABS MHSI - Retail	4.3	4.6	-

Month-on-month growth (% s.a.)			
	Jun-25	Jul-25	Aug-25
NAB Online Index	2.3	-1.1	-0.1
ABS MHSI - Retail	0.8	-0.2	-

## Comments from NAB Chief Economist Sally Auld

For the Online Retail Sales series, we have observed heightened volatility in growth over the past three months. Some of this volatility is typical of the series, especially around sales events, but is probably more noticeable this year given the somewhat stable growth period between January and May. Our monthly trend series in August points to improved sales growth in the near term, and this looks likely across most states, especially smaller sales states.

Of note this month was the rebound in fashion, although this category tends to be more volatile relative to others. While growth for fashion was particularly high in the smaller sales states, it was positive across all regions. Also noticeable this month was the strong growth by international retailers (especially department stores, games and toys, and personal and recreational goods).

## About this report

The NAB Online Retail Sales Index is now sourced in-house and is produced by Group Economics. We have made some significant changes to the NAB online series. Importantly, we have merged SME and Corporate Online into a single index, and provide more detail by region and industry on a monthly basis.

It is derived from NAB transactions data that have been assigned from particular merchant codes to retail industries by state. To keep the series reasonably consistent with past series, we have left these category descriptions broadly unchanged, albeit we now include new entrants to the Australian market. Against that, we have however removed the standalone previously reported category of 'Daily Deals', as this category was considerably volatile and caused statistical issues with indirect seasonal adjustment.

The NAB Online Retail Sales Index measures all Online Retail spending by consumers using various electronic payment methods such as credit cards, BPAY, and PayPal. We have made adjustments for where merchants appear to be wholesaling goods as opposed for final household consumption, and also incorporate new standards involving purchases using stored customer details. The index is derived from personal transaction data from NAB platforms and is scaled up to be representative of the economy by using scalars including ABS Estimated Resident Population, and RBA payments data.

NAB electronic transactions data for the compilation of this series is collected in real time at event record level, which allows significant flexibility to segment the data by age, time, location and merchant type. In future months, we plan to expand the data provided from the series as we bed-in acceptable seasonal adjustment factors for the new series. Transactions included in these data may incorporate purchases by Card, BPAY, Bank Transfers, Direct Debits and PayPal services where available, and include transactions with Australian and international merchants. Spending represented here includes transactions we have identified as online. NAB's estimate of the online retail market is larger than that of the official ABS measure of Online retail trade as it covers businesses that may not be within the remit of the ABS business register, such as overseas online retailers.

In the previously published series, we were using online retail sales by merchants with turnover greater than \$2.5m ('Corporate') as a proxy for online sales growth of the whole online market. This was due to the shorter time series of the previous market estimate and associated seasonal adjustment issues. With the new extract, we now have sufficient time series, and the growth rates represented are for the total market – i.e. Corporate and SME combined in a single series.

The data captures electronic retail online transactions and is therefore subject to the changing nature and take-up rate of electronic payment methods. Hence, change in growth in the overall transaction value may be attributable to either an increased preference towards a payment type by consumers (such as buy now pay later schemes), or a change in the level of spending across the economy by consumers, i.e. a pick-up in nominal online sales. We continue to work to isolate these effects.

Customer spending is based on where the customer lives, which may or may not be where the actual spending activity occurs. Customers without an Australian residential address are excluded.

These estimates are developed from transaction micro level data are then aggregated to higher level categories based on transaction attributes. The data is made representative of national sales activity by applying both demographic attributes to customer location using the most recent ABS Estimated Resident Population, and comparing NAB transaction data to RBA payments system data. Changes in these data are reflected in the NORSI market size estimate timeseries.

The industry and state data have been seasonally adjusted using Tramo-SEATS with a trading day and Easter adjustment. Given the relatively short time frame for the data, this seasonal adjustment process should be regarded as provisional: estimates are likely to change as a longer run of data becomes available and can be revised from month-to-month given the concurrent process. The trends have been extracted from the same process.

Our aim is to have a data series that is as reflective as possible of online retail spend. As such, each month we will revise previous data to take into account changes in payment processing such as chargebacks and delayed payments. Given these attributes, typically, larger revisions occur to the most recent months, and diminish as the data ages, but the latter effect cannot be excluded.

Our data differs to that of the ABS series as the NAB series covers a broader spectrum of online retailers – overseas merchants selling to Australian residents for example, and categories that substitute for previously retail purchased goods. Categories such as music and book retailing, and electronic games form part of the current online estimate. These are now substitutes for what may have been purchased in-store, but are now provided by online media streaming companies. While these may not fit the strict retail trade definition, our data reveals that they are increasingly being used by customers who previously purchased media in-store. We incorporate these companies into our estimate of online retail sales.

As part of the continual improvement of the series, this month we have revised our total market estimates. We have identified and removed potential wholesale trade transactions made on personal accounts. We have also identified more transactions that are made using a 'stored credentials' technique of online purchases. This technique is increasing in popularity as consumers opt for convenience especially with purchases made using mobile apps. Finally, in March 2018 the RBA made changes to its Payments System Data which we use as an input into our estimate of online total market size. These revisions are retrofitted to the series history.

We have also added a comparison based on metropolitan and regional areas. The definition of these geographical areas is based on the ABS geographical concordance tables, specifically the Greater Capital City Statistical Areas (GCCSAs).
