

# NAB CASHLESS RETAIL SALES INDEX JANUARY 2020

*NAB Group Economics*

## HIGHLIGHTS

- Our data mapping suggests that the ABS retail trade measure will rise 0.2% m/m in January 2020. The ABS printed a 0.5% fall in December 2019, while we forecast -0.1% (revised to -0.2%).
- The strong November and weak December ABS prints in part reflect the new and ever-expanding Black Friday sales, which have brought forward Christmas spending into November and are not yet fully captured in the ABS seasonal adjustment methodology. The underlying trend however, remains one of generally weak retail spending, reflecting a consumer burdened by high debt and slow wage growth. Unless these are remedied, it is unlikely that the retail sector will see a sustained uplift.
- Last month, we flagged that the catastrophic bushfire season could damage consumer confidence in January and February. Based on this and other data (including our **special bushfires survey**), it now appears that this has not been a major factor outside fire-affected areas, although we remain concerned about the tourism sector, particularly given the emergence of strict travel restrictions due to coronavirus.

## COMMENTS FROM NAB GROUP CHIEF ECONOMIST ALAN OSTER

*Our forecast points to a moderate rise in the ABS retail sales measure in January (+0.2% m/m), following an underwhelming end to 2019. While the negative December ABS print was partly about seasonal factors, the first result for 2020 shows that consumers remain reluctant to spend amid high debt and slow wage growth.*

*Last month we flagged that the bushfire season could damage consumer confidence in early 2020. While the fires have been absolutely devastating in many areas, they do not appear to have seen large second round consumer confidence impacts for capital city retailers.*

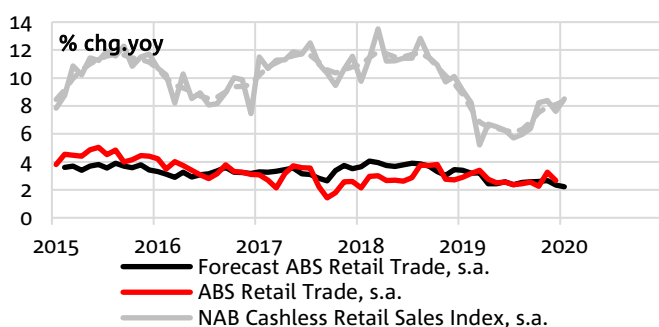

*Coronavirus has badly dented Chinese GDP growth and will be a headwind for Australia in Q1. As outlined in **our latest economic forecasts**, coronavirus, combined with bushfires, is likely to lead to a small negative GDP print for Q1 2020. Much of that will come from weaker consumption and a hit to tourism, education, commodity prices and incomes. We assume – and hope – that most of the bushfire and coronavirus downside will have passed by Q2. Nonetheless, we do not expect much stronger consumption growth until 2021.*

Year-on-year growth (% s.a.)			
	Nov-19	Dec-19	Jan-20
NAB Cashless Index*	8.4	7.6	8.5
ABS Retail Trade	3.3	2.7	--
NAB ABS Retail Trade forecast	2.7	2.3	2.2

Month-on-month growth (% s.a.)			
	Nov-19	Dec-19	Jan-20
NAB Cashless Index*	0.7	0.1	1.2
ABS retail Trade	1.0	-0.5	--
NAB ABS Retail Trade forecast	0.5	-0.2	0.2

Charts 9&10: Cashless sales by state, trend

## **ABOUT THE INDEX**

The NAB Cashless Retail Index is broader than the NAB Online Retail Index and measures all cashless retail spending by consumers using debit and credit cards (both in person and online), BPAY and Paypal. The index is derived from personal transaction data from NAB platforms (around 2 million transactions per day) and offers a 2-3 week lead on ABS retail trade data. Likely reflecting the increasing popularity of online and contactless payments, the NAB Cashless Retail Index has continued to outpace the ABS measure of retail.

RBA research suggests 18% of the value of retail trade occurred via cash in 2016. We use mapping equations to forecast the official ABS measure of retail trade. Over time, the growth rates of the two series are likely to come together.

## APPENDIX: METHODOLOGY AND COMPARISON WITH ABS RETAIL TRADE

The NAB Cashless Retail Sales Index is derived from NAB transactions data that have been assigned from particular merchant codes to retail industries by state. NAB electronic transactions data are based on an average 2 million transactions per day. The data are collected in real time at event record level, which allows significant flexibility to segment the data by time, location and merchant type. Transactions data may include EFTPOS, Credit Card, BPAY, Bank Transfers, Direct Debits and Paypal services where available, and include transactions with Australian and international merchants. Spending includes both online and offline transactions. The data excludes cash withdrawals made during a purchase and purchases made offline in an overseas location.

The data only capture electronic retail transactions (and not those through cash payments), hence it is subject to the changing nature and take-up rate of electronic payment methods relative to cash. Any growth in the overall transaction value may be attributable to either an increased preference towards card-based payments by consumers (such as near-field payment “PayWave”), or a higher level of spending across the economy by consumers, i.e. a pick-up in nominal sales. However, it is currently not possible to differentiate between these effects. Customer spending is based on where the customer lives, which may or may not be where the actual spending activity occurs. Customers without an Australian residential address are excluded.

These estimates are aggregated into national industries by applying to them the state shares of each industry from the ABS retail trade publication. State estimates are aggregated by applying the industry shares of each state from the same source. These adjustments are intended to correct for differences between the incidence of NAB transactions across industries and states when compared with the official ABS data.

The industry and state data have been seasonally adjusted using Tramo-SEATS with a trading day and Easter adjustment. Given the relatively short time frame for the data, this seasonal adjustment process should be regarded as provisional: estimates are likely to change as a longer run of data becomes available, and can be revised from month-to-month given the concurrent process. The trends have been extracted from the same process.

Our aim is to have a data series that is as reflective as possible of retail spend. As such each month we will revise previous data to take into account changes in payment processing such as chargebacks and delayed payments. Given these attributes, typically, larger revisions occur to the most recent months, and diminish as the data ages.

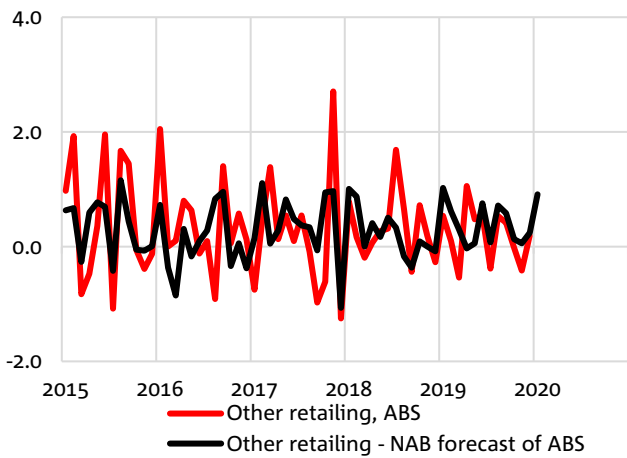

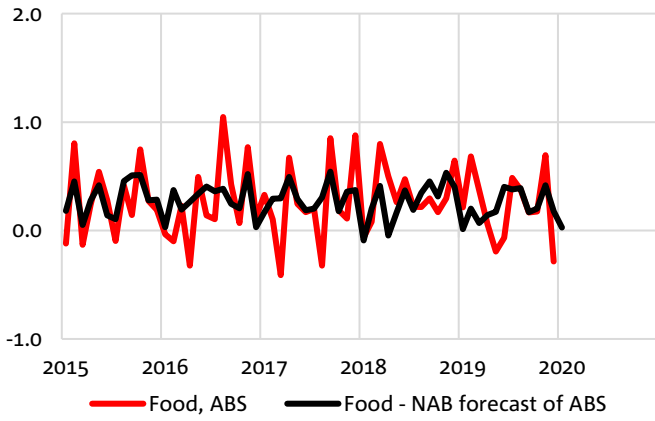

After appropriate weighting and seasonal adjustment, the components of NAB’s cashless retail index (food, household goods, clothing & footwear, department stores, other retailing and cafes, restaurants & takeaway) can generate predictions of the corresponding ABS retail trade series. Aggregating these provides a forecast of total ABS retail trade.

The charts in the appendix show the relationship between the ABS total and NAB Cashless retail sales measures mapped to the ABS using monthly seasonally adjusted data, for the main retail industry groups. The sources of difference between the two series are:

- The inclusion of cash transactions in the ABS measure and changes in their share of total transactions. This share may begin to stabilise as the penetration of contactless payment systems reaches a limit reflecting minimum spend requirements for cashless transactions and because of the existence of a proportion of merchants who deal only in cash.
- The NAB data include a larger share of online transactions (7%) than the ABS (3%).
- Changes in NAB’s market share of cashless transactions.
- Differences between the seasonality in the ABS and NAB series.

Therefore, the forecasts from the use of the NAB Cashless Retail Index should be used with caution.

Comparisons between mapped NAB series and ABS data by retail industry group, s.a. % change m/m
