

NAB CASHLESS RETAIL SALES INDEX JUNE 2022

NAB Group Economics

HIGHLIGHTS

- Our data mapping points to a small negative retail sales print in June. We see the official ABS measure dropping 0.1% on a month-on-month basis as nervous consumers react to weaker economic expectations, high inflation and rising interest rates.
- Our series (along with some others) have been notably weaker than the ABS prints recently. There is a chance the ABS could defy expectations and print another strong result in June, although this is increasingly less likely as consumer sentiment shifts. That said, our weekly tracking data picked up an abnormally strong consumption figure for the last week of the financial year, suggesting some strength on the part of the consumer.
- Price pressures continue to mount across much of the economy and the RBA continues to hike rates – including an additional 50bp last week. We see another 50bp rise in August, followed by 25bp rises in September, November and February. This will dent consumer spending activity.

COMMENTS FROM NAB GROUP CHIEF ECONOMIST ALAN OSTER

While our latest weekly tracking data reported unexpectedly high spending on end of financial year sales, overall retail spending looks to be coming under increasing pressure as consumers weigh gloomy economic expectations against a tight labour market.

Our retail sales forecast points to a small decline this month, with only cafes, restaurants and takeaways outperforming. This underlines our view that consumers have shifted spending from goods to services as covid restrictions have eased. Our data also show stronger spending in Victoria and New South Wales, although this is unlikely to persist as all states share similar consumer sentiment risks.

The June NAB Monthly Business Survey recorded a sharp drop in confidence for the retail sector – down 21 points into negative territory. Product price growth remains very elevated – the survey measure of retail final product prices rose 2.9% in June at a quarterly rate. The survey data is consistent with CPI hitting a new record in Q2, which is likely to drive further RBA rate rises. Indeed, rapid retail price growth is likely obscuring weak real retail sales.

	Year-on-year growth (% s.a.)		
	Apr-22	May-22	Jun-22
NAB Cashless Index*	14.9	11.0	14.6
ABS Retail Trade	9.6	10.4	--
NAB ABS Retail Trade forecast	4.7	3.3	4.1

	Month-on-month growth (% s.a.)		
	Apr-22	May-22	Jun-22
NAB Cashless Index*	4.4	-2.2	2.3
ABS retail Trade	0.9	0.9	--
NAB ABS Retail Trade forecast	1.7	-0.5	-0.1

ABOUT THE INDEX

The NAB Cashless Retail Index is broader than the NAB Online Retail Index and measures all cashless retail spending by consumers using debit and credit cards (both in person and online), BPAY and Paypal. The index is derived from personal transaction data from NAB platforms (around 2 million transactions per day) and offers a 2-3 week lead on ABS retail trade data. Likely reflecting the increasing popularity of online and contactless payments, the NAB Cashless Retail Index has continued to outpace the ABS measure of retail.

RBA research suggests 18% of the value of retail trade occurred via cash in 2016. We use mapping equations to forecast the official ABS measure of retail trade. Over time, the growth rates of the two series are likely to come together, hastened this year by the decline in the use of cash.

APPENDIX: METHODOLOGY AND COMPARISON WITH ABS RETAIL TRADE

The NAB Cashless Retail Sales Index is derived from NAB transactions data that have been assigned from particular merchant codes to retail industries by state. NAB electronic transactions data are based on an average 2 million transactions per day. The data are collected in real time at event record level, which allows significant flexibility to segment the data by time, location and merchant type. Transactions data may include EFTPOS, Credit Card, BPAY, Bank Transfers, Direct Debits and Paypal services where available, and include transactions with Australian and international merchants. Spending includes both online and offline transactions. The data excludes cash withdrawals made during a purchase and purchases made offline in an overseas location.

The data only capture electronic retail transactions (and not those through cash payments), hence it is subject to the changing nature and take-up rate of electronic payment methods relative to cash. Any growth in the overall transaction value may be attributable to either an increased preference towards card-based payments by consumers (such as near-field payment “PayWave”), or a higher level of spending across the economy by consumers, i.e. a pick-up in nominal sales. However, it is currently not possible to differentiate between these effects. Customer spending is based on where the customer lives, which may or may not be where the actual spending activity occurs. Customers without an Australian residential address are excluded.

These estimates are aggregated into national industries by applying to them the state shares of each industry from the ABS retail trade publication. State estimates are aggregated by applying the industry shares of each state from the same source. These adjustments are intended to correct for differences between the incidence of NAB transactions across industries and states when compared with the official ABS data.

The industry and state data have been seasonally adjusted using Tramo-SEATS with a trading day and Easter adjustment. Given the relatively short time frame for the data, this seasonal adjustment process should be regarded as provisional: estimates are likely to change as a longer run of data becomes available, and can be revised from month-to-month given the concurrent process. The trends have been extracted from the same process.

Our aim is to have a data series that is as reflective as possible of retail spend. As such each month we will revise previous data to take into account changes in payment processing such as chargebacks and delayed payments. Given these attributes, typically, larger revisions occur to the most recent months, and diminish as the data ages.

After appropriate weighting and seasonal adjustment, the components of NAB’s cashless retail index (food, household goods, clothing & footwear, department stores, other retailing and cafes, restaurants & takeaway) can generate predictions of the corresponding ABS retail trade series. Aggregating these provides a forecast of total ABS retail trade.

The charts in the appendix show the relationship between the ABS total and NAB Cashless retail sales measures mapped to the ABS using monthly seasonally adjusted data, for the main retail industry groups. The sources of difference between the two series are:

- The inclusion of cash transactions in the ABS measure and changes in their share of total transactions. This share may begin to stabilise as the penetration of contactless payment systems reaches a limit reflecting minimum spend requirements for cashless transactions and because of the existence of a proportion of merchants who deal only in cash.
- The NAB data include a larger share of online transactions (7%) than the ABS (3%).
- Changes in NAB’s market share of cashless transactions.
- Differences between the seasonality in the ABS and NAB series.

Therefore, the forecasts from the use of the NAB Cashless Retail Index should be used with caution.
