

NAB Online Retail Sales Index September 2024

NAB Group Economics

Key Points

- **On a month-on-month, seasonally adjusted basis, the index recorded rapid growth in September (2.4%),** following a slight upward revision to August (0.1%, was 0.0%).
- **Growth also accelerated in year-on-year terms (12.4% y/y),** with August revised up slightly (9.9%, was 9.8% previously published).
- **While growth was recorded for all categories in September, an acceleration was observed for only half the categories. Large sales category, homewares and appliances, led monthly growth, rebounding rapidly in September, along with department stores.** Rapid monthly growth for the latter category also boosted its growth in year-on-year terms, where it continues to lead. For more detail, see charts 3, 5, 7 & 8 and table 3 below.
- **Growth was recorded for all states and territories except NT this month, with rapid acceleration for WA and a rebound for both VIC and ACT.** Slower growth for the grocery and liquor category can be attributed to the two large sales states, NSW and VIC, which recorded a contraction for the category. See charts 4, 6, 9-14, and table 3 for more detail.
- **While in aggregate, metro areas led growth, the results were mixed by state with NSW and SA growth clearly driven by metro while regional growth supported VIC and WA.** In year-on-year terms, metro growth continues to outpace regional, but again this was most evident in NSW and SA, with results in all other states far closer, and favouring regional. See Charts 15 and 16 for more detail.
- **Both domestic and international retailers recorded growth in the month, with the former only slightly faster.** In year-on-year terms, the gap between domestic and international has closed in recent months as international rebounded. See charts 13 and 14, and table 4 for category growth and share.
- **NAB estimates that in the 12 months to September, Australians spent \$58.79 billion on online retail,** a level that is around 13.7% of the total retail trade estimate (August 2024, Series 8501, Australian Bureau of Statistics), with growth (8.5%) improving on the month prior.

Year-on-year growth (% s.a.)			
	Jul-24	Aug-24	Sep-24
NAB Online Index	9.4	9.9	12.4
ABS Retail Trade	2.4	3.1	-

Month-on-month growth (% s.a.)			
	Jul-24	Aug-24	Sep-24
NAB Online Index	-2.6	0.1	2.4
ABS Retail Trade	0.1	0.7	-

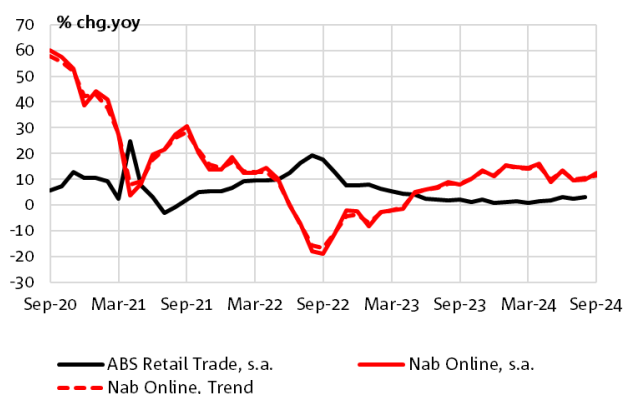

Chart 2: NAB Online retail trade data (mom, s.a.)

Comments from NAB Chief Economist Alan Oster

Growth for online retail sales in month on month, seasonally adjusted terms, accelerated in September. The index has improved for the past two months, after weakness in July. In August, the two largest sales categories, homewares and appliances, and department stores, along with mid-size category personal and recreational goods, contracted, netting growth from other categories. The rebound in growth for these categories in September has been considerable.

Over the year, department store growth has been rapid, and this has been particularly noticeable in TAS, WA ACT, and QLD, with VIC and NSW slightly slower than the aggregate for the category. Indeed, over the past two years, WA has, on average, ranked either first or second for year-on-year growth for this category, while VIC has generally ranked lower.

Chart 3: Online retail sales by category, yoy s.a.

Chart 4: Online retail sales by state, yoy s.a.

Chart 5: Online retail sales by category, mom s.a.

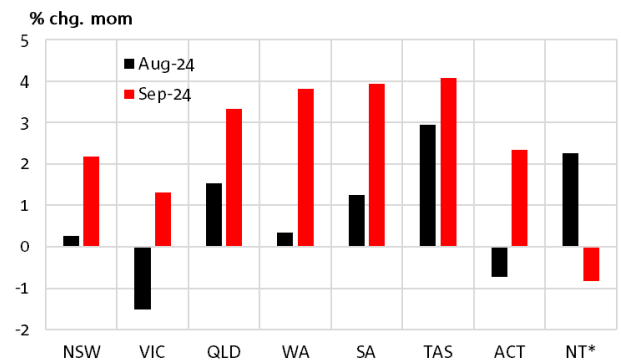

Chart 6: Online retail sales by state, mom s.a.

* Note that the series representing Northern Territory is highly variable and should be used with caution.

About this report

The NAB Online Retail Sales Index is now sourced in-house and is produced by Group Economics. We have made some significant changes to the NAB online series. Importantly, we have merged SME and Corporate Online into a single index, and provide more detail by region and industry on a monthly basis.

It is derived from NAB transactions data that have been assigned from particular merchant codes to retail industries by state. To keep the series reasonably consistent with past series, we have left these category descriptions broadly unchanged, albeit we now include new entrants to the Australian market. Against that, we have however removed the standalone previously reported category of 'Daily Deals', as this category was considerably volatile and caused statistical issues with indirect seasonal adjustment.

The NAB Online Retail Sales Index measures all Online Retail spending by consumers using various electronic payment methods such as credit cards, BPAY, and PayPal. We have made adjustments for where merchants appear to be wholesaling goods as opposed for final household consumption, and also incorporate new standards involving purchases using stored customer details. The index is derived from personal transaction data from NAB platforms and is scaled up to be representative of the economy by using scalars including ABS Estimated Resident Population, and RBA payments data.

NAB electronic transactions data for the compilation of this series is collected in real time at event record level, which allows significant flexibility to segment the data by age, time, location and merchant type. In future months, we plan to expand the data provided from the series as we bed-in acceptable seasonal adjustment factors for the new series. Transactions included in these data may incorporate purchases by Card, BPAY, Bank Transfers, Direct Debits and PayPal services where available, and include transactions with Australian and international merchants. Spending represented here includes transactions we have identified as online. NAB's estimate of the online retail market is larger than that of the official ABS measure of Online retail trade as it covers businesses that may not be within the remit of the ABS business register, such as overseas online retailers.

In the previously published series, we were using online retail sales by merchants with turnover greater than \$2.5m ('Corporate') as a proxy for online sales growth of the whole online market. This was due to the shorter time series of the previous market estimate and associated seasonal adjustment issues. With the new extract, we now have sufficient time series, and the growth rates represented are for the total market – i.e. Corporate and SME combined in a single series.

The data captures electronic retail online transactions and is therefore subject to the changing nature and take-up rate of electronic payment methods. Hence, change in growth in the overall transaction value may be attributable to either an increased preference towards a payment type by consumers (such as buy now pay later schemes), or a change in the level of spending across the economy by consumers, i.e. a pick-up in nominal online sales. We continue to work to isolate these effects.

Customer spending is based on where the customer lives, which may or may not be where the actual spending activity occurs. Customers without an Australian residential address are excluded.

These estimates are developed from transaction micro level data are then aggregated to higher level categories based on transaction attributes. The data is made representative of national sales activity by applying both demographic attributes to customer location using the most recent ABS Estimated Resident Population, and comparing NAB transaction data to RBA payments system data. Changes in these data are reflected in the NORSI market size estimate timeseries.

The industry and state data have been seasonally adjusted using Tramo-SEATS with a trading day and Easter adjustment. Given the relatively short time frame for the data, this seasonal adjustment process should be regarded as provisional: estimates are likely to change as a longer run of data becomes available and can be revised from month-to-month given the concurrent process. The trends have been extracted from the same process.

Our aim is to have a data series that is as reflective as possible of online retail spend. As such, each month we will revise previous data to take into account changes in payment processing such as chargebacks and delayed payments. Given these attributes, typically, larger revisions occur to the most recent months, and diminish as the data ages, but the latter effect cannot be excluded.

Our data differs to that of the ABS series as the NAB series covers a broader spectrum of online retailers – overseas merchants selling to Australian residents for example, and categories that substitute for previously retail purchased goods. Categories such as music and book retailing, and electronic games form part of the current online estimate. These are now substitutes for what may have been purchased in-store, but are now provided by online media streaming companies. While these may not fit the strict retail trade definition, our data reveals that they are increasingly being used by customers who previously purchased media in-store. We incorporate these companies into our estimate of online retail sales.

As part of the continual improvement of the series, this month we have revised our total market estimates. We have identified and removed potential wholesale trade transactions made on personal accounts. We have also identified more transactions that are made using a 'stored credentials' technique of online purchases. This technique is increasing in popularity as consumers opt for convenience especially with purchases made using mobile apps. Finally, in March 2018 the RBA made changes to its Payments System Data which we use as an input into our estimate of online total market size. These revisions are retrofitted to the series history.

We have also added a comparison based on metropolitan and regional areas. The definition of these geographical areas is based on the ABS geographical concordance tables, specifically the Greater Capital City Statistical Areas (GCCSAs).
