

NAB Online Retail Sales Index

JUNE 2025

NAB Group Economics

Key Points

- **In June, on a seasonally adjusted basis, the NAB Online Retail Sales Index accelerated rapidly (2.6% mom) on the month prior (May slightly revised 0.8%, was 0.7%).**
- **Growth accelerated again in year-on-year terms (16.2% yoy)** and continues to trend higher over the recent period.
- **Growth accelerated for all categories in the month, except takeaway food, and grocery and liquor.** Large sales category, homewares and appliances, which contracted in May, rebounded strongly in June, leading growth in the month by a fair margin, and contributed strongly to the overall result. Growth also accelerated for personal and rec goods, media, and department stores, while games and toys, and fashion slowed. In year-on-year terms, the department stores category continues to outpace other categories, albeit slowing slightly in June. For more detail, see Charts 3, 5, 7 & 8 and Table 3 below.
- **All states recorded growth this month, with a strong rebound for the three states (SA, WA, TAS) that recorded a drop in the prior month, especially SA which led growth.** There was also a strong acceleration for NSW, ACT, and QLD. The boost to growth for most states was from homewares and appliances, except TAS, where department stores and fashion were far stronger. See Charts 4, 6, 9-14, and Table 3 for more detail.
- **While growth was recorded in both metro and regional areas, it accelerated in the former, with QLD factoring heavily in the result.** WA on the other hand, was boosted by regional areas. See Charts 15 and 16 for more detail.
- **Growth accelerated for domestic retailers in the month, with a slowdown for international.** See Charts 13 and 14, and Table 4 for category growth and share.
- **NAB estimates that in the 12 months to June, Australians spent \$64.19 billion on online retail,** a level that is around 14.5% of the total retail trade estimate (May 2025, Series 8501, Australian Bureau of Statistics), with the 12-months-to growth (13.5%) continuing to accelerate.

Year-on-year growth (% s.a.)			
	Apr-25	May-25	Jun-25
NAB Online Index	13.2	15.6	16.2
ABS Retail Trade	3.8	3.3	-

Month-on-month growth (% s.a.)			
	Apr-25	May-25	Jun-25
NAB Online Index	1.0	0.8	2.6
ABS Retail Trade	0.0	0.2	-

Comments from NAB Chief Economist Sally Auld

We observed robust growth for online retail sales in June (2.6% mom, s.a.), a stronger growth rate relative to our broader retail measure, the NAB Monthly Data Insights (0.9% mom). For online, the improvement in trend monthly growth has begun to bolster the annual growth rates, especially for domestic retailers. Our data also suggest that the online share of total retail continues to grow. Average spend also grew in the month for key growth categories, particularly homewares and appliances, and personal and recreational goods, where both volume of transactions and dollars spent increased. Alongside recent improvement in our broader retail measure, these data are consistent with our view that household consumption should improve as we move into the second half of the calendar year.

All categories	2.8	0.4	15.7	21.4	92.2	7.8	100

About this report

The NAB Online Retail Sales Index is now sourced in-house and is produced by Group Economics. We have made some significant changes to the NAB online series. Importantly, we have merged SME and Corporate Online into a single index, and provide more detail by region and industry on a monthly basis.

It is derived from NAB transactions data that have been assigned from particular merchant codes to retail industries by state. To keep the series reasonably consistent with past series, we have left these category descriptions broadly unchanged, albeit we now include new entrants to the Australian market. Against that, we have however removed the standalone previously reported category of 'Daily Deals', as this category was considerably volatile and caused statistical issues with indirect seasonal adjustment.

The NAB Online Retail Sales Index measures all Online Retail spending by consumers using various electronic payment methods such as credit cards, BPAY, and PayPal. We have made adjustments for where merchants appear to be wholesaling goods as opposed for final household consumption, and also incorporate new standards involving purchases using stored customer details. The index is derived from personal transaction data from NAB platforms and is scaled up to be representative of the economy by using scalars including ABS Estimated Resident Population, and RBA payments data.

NAB electronic transactions data for the compilation of this series is collected in real time at event record level, which allows significant flexibility to segment the data by age, time, location and merchant type. In future months, we plan to expand the data provided from the series as we bed-in acceptable seasonal adjustment factors for the new series. Transactions included in these data may incorporate purchases by Card, BPAY, Bank Transfers, Direct Debits and PayPal services where available, and include transactions with Australian and international merchants. Spending represented here includes transactions we have identified as online. NAB's estimate of the online retail market is larger than that of the official ABS measure of Online retail trade as it covers businesses that may not be within the remit of the ABS business register, such as overseas online retailers.

In the previously published series, we were using online retail sales by merchants with turnover greater than \$2.5m ('Corporate') as a proxy for online sales growth of the whole online market. This was due to the shorter time series of the previous market estimate and associated seasonal adjustment issues. With the new extract, we now have sufficient time series, and the growth rates represented are for the total market – i.e. Corporate and SME combined in a single series.

The data captures electronic retail online transactions and is therefore subject to the changing nature and take-up rate of electronic payment methods. Hence, change in growth in the overall transaction value may be attributable to either an increased preference towards a payment type by consumers (such as buy now pay later schemes), or a change in the level of spending across the economy by consumers, i.e. a pick-up in nominal online sales. We continue to work to isolate these effects.

Customer spending is based on where the customer lives, which may or may not be where the actual spending activity occurs. Customers without an Australian residential address are excluded.

These estimates are developed from transaction micro level data are then aggregated to higher level categories based on transaction attributes. The data is made representative of national sales activity by applying both demographic attributes to customer location using the most recent ABS Estimated Resident Population, and comparing NAB transaction data to RBA payments system data. Changes in these data are reflected in the NORSI market size estimate timeseries.

The industry and state data have been seasonally adjusted using Tramo-SEATS with a trading day and Easter adjustment. Given the relatively short time frame for the data, this seasonal adjustment process should be regarded as provisional: estimates are likely to change as a longer run of data becomes available and can be revised from month-to-month given the concurrent process. The trends have been extracted from the same process.

Our aim is to have a data series that is as reflective as possible of online retail spend. As such, each month we will revise previous data to take into account changes in payment processing such as chargebacks and delayed payments. Given these attributes, typically, larger revisions occur to the most recent months, and diminish as the data ages, but the latter effect cannot be excluded.

Our data differs to that of the ABS series as the NAB series covers a broader spectrum of online retailers – overseas merchants selling to Australian residents for example, and categories that substitute for previously retail purchased goods. Categories such as music and book retailing, and electronic games form part of the current online estimate. These are now substitutes for what may have been purchased in-store, but are now provided by online media streaming companies. While these may not fit the strict retail trade definition, our data reveals that they are increasingly being used by customers who previously purchased media in-store. We incorporate these companies into our estimate of online retail sales.

As part of the continual improvement of the series, this month we have revised our total market estimates. We have identified and removed potential wholesale trade transactions made on personal accounts. We have also identified more transactions that are made using a 'stored credentials' technique of online purchases. This technique is increasing in popularity as consumers opt for convenience especially with purchases made using mobile apps. Finally, in March 2018 the RBA made changes to its Payments System Data which we use as an input into our estimate of online total market size. These revisions are retrofitted to the series history.

We have also added a comparison based on metropolitan and regional areas. The definition of these geographical areas is based on the ABS geographical concordance tables, specifically the Greater Capital City Statistical Areas (GCCSAs).
